

Matched aggregate metrics, different phase-exposure profiles

Two illustrative schedules can have equal gate count, depth, and total idle time while exposing different phase-bearing windows.

■ Gate / active operation ■ Idle interval ■ Phase-bearing window ■ Exposure overlap

Variant A

Idle overlaps
phase window
Higher exposure

Variant B

Idle outside
phase window
Lower exposure

Same aggregate metrics:

gate count, depth, and total idle time

Different diagnostic variable:

time spent inside readout-relevant phase-bearing windows

Illustrative schematic only: not a disclosed circuit instance, schedule, backend, or implementation workflow.
